# General information on 21A POLYWELL CAPS models

Supply voltage ( $V_{dd}$ ) is 1.2 V.

Validity domain is defined as follows:

$V_{gs}$ ,  $V_{ds}$  and  $V_{bs}$  vary from 0 V to 1.32 V (i.e.  $V_{dd} + 10\%$ ).

## Conditions of simulation

Simulations were done with Bench v3.6.3sram using Eldo simulator v6.7\_1.2.

If not explicitly mentioned elsewhere, temperature is set to 25 ° C and Vbs to 0 V.

## Output parameters definition

In what follows, M, W and L (all default to 1) designate the number of devices in parallel (i.e. multiplication factor), the total drawn gate width and the drawn gate length, respectively.

- **Cgg\_inv**: Total gate capacitance at  $V_{gs} = 1.2 \text{ V}$ ,  $V_{ds} = 0 \text{ V}$ ,  $f = 100\text{k Hz}$ .
- **Cgd\_0V**: Gate-to-Drain capacitance at  $V_{gs} = 0 \text{ V}$ ,  $V_{ds} = 0 \text{ V}$ ,  $f = 100\text{k Hz}$ .
